

**INVITED SESSION ON
Knowledge and sensing services for the Factory of the Future applications**

(code 213i5)

Sponsored by

- IFAC TC 5.3 “Enterprise Integration and Networking”
- GDR MACS Working Group INCAS
- IFIP TC 5 “Information Technology Applications” **(to be confirmed)**
- IFIP TC 12 “Artificial Intelligence” **(to be confirmed)**

Organisers

Mario Lezoche, University of Lorraine, France (mario.lezoche@univ-lorraine.fr)

Diego Torres, National University of La Plata, Argentina (diego.torres@lifa.info.unlp.edu.ar)

Eduardo Rocha Loures, Pontifical Catholic University of Parana, Brazil (eduardo.loures@pucpr.br)

Michele Dassisti, Politecnico di Bari, Italy (michele.dassisti@poliba.it)

Keywords: Knowledge formalisation, Internet-of-services, Enterprise Information Systems, System-to-System communication, Systems Interoperability, Factory of the future, Cyber-physical System, Data fusion, multi-sensor data fusion

Scope:

Systems integration, cooperative communication and information processing technologies for enterprise operation represent some key focus in the new global market. These issues are closely intertwined to information processing and distributed information systems, where the knowledge technologies play a major role. This evolution context brings about the concept of smart services as a next-generation services provided via all the possible technological channels but, at the same time, the challenge of a different vision of manufacturing operation and management.

The Factory of the Future (FoF) revolution is thus focused on developing a smart physical environment where the production is interlaced to knowledge: matter and information as two faces of the same medal. It is the current trends of automation and data exchanges in manufacturing technologies that include development of cyber-physical systems, cognitive computing, cloud computing, Internet of Things among the most known technologies. The development of knowledge sharing for manufacturing operation led to important results in various domains practices: the development of accuracy and transparency in several industrial sectors, for instance like the agricultural industry. Other new challenges are arising to the research at the same time: the key necessity to enable data exchanges in the business ecosystem and the need to invest in new physical infrastructure and tools. In collaborative and cooperative environments, the enterprises have been exploring several aspects of their processes and services to determine which ones can be better managed through ICT. Nowadays, these services are also facing the need of integrating physical and virtual objects through the exploitation of data capture and communication capabilities. To overcome challenges related to acquisition and analysis of a large amount of data, the Data Fusion strategy has gained focus as a data pre-processing phase to support the fast-growing data-intensive applications.

FoF is using advanced technologies such as networking sensors, smart devices, sensing machines, robots, GPS technology which will allow enterprises to be more profitable, efficient, safe, and environmentally friendly. This impulse is totally towards the development of cooperative services and applications. These innovative services have to meet the requirements of a high degree of autonomous data capture, event transfer, network connectivity and interoperability as a support of the physical transformations.

Enterprises, to optimise their knowledge processes and services, use acquired and innovative technologies, such as wireless network, remote sensor data acquisition, mobile information technology, services and processes architectures managing the operations of the enterprise systems. Based on

innovative services, this requires the conceptualisation and the formalisation of the models and methods to generalise proposed services in every heterogeneous system.

This Invited Session on “Knowledge and sensing services in Enterprise Information Systems to support multi-domains solutions in Factory of the Future applications” focuses on presenting the latest research achievements of the scientific community within the above-mentioned perspectives and trends.

Authors are invited to submit original contributions on all aspects including but not limited to:

- Knowledge formalisation methods
- Distributed Information Systems: Models, Architecture and Frameworks
- Systems Interoperability
- Web Services in IoT context
- Sensing services: innovative technologies and processes
- Internet-of-Things: innovative technologies and methods
- Multi sensors Data Fusion
- Smart Communicative Objects
- System to System Communication
- Semantic Interoperability in Internet-of-Things and Internet-of-Services
- Wireless Technologies and Architectures
- ICT Infrastructures/Platforms for Mobility
- Conceptual Modeling and Simulation of Distributed Technologies
- Process modelling and deployment of Cooperative Information System
- Advanced and smart manufacturing technologies
- Smart sensing system for manufacturing sustainability
- Knowledge management for manufacturing operations

Papers must be submitted electronically using the IFAC PaperPlaza Conference Manuscript Management System: www.ifac.papercept.net. All submissions must be in PDF format, written in English, and prepared according to the IFAC format.

Please visit www.ifac.papercept.net/conferences/manuals/authorgetstarted.pdf for detailed instructions. Papers submissions will be due before **October 31th, 2019** through the conference submission platform, selecting “invited paper” and entering the session **code 213i5**.

Distinguished papers based on their fast-track review and oral presentation will be selected and published in an extended journal article form as part of a special issue.
